Creating an Arithmetic Calculator

The code for this project is hosted at https://github.com/AmitDhanorkar/Arithmetic-Calculator.

The project is developed by Amit Dhanorkar.

Sprints planning and Task completion

The project is planned to be completed in 1 sprint. Tasks assumed to be completed in the sprint are:

• Initializing git repository to track changes as development progresses.

• Writing the Java program to fulfil the requirements of the project.

• Testing the Java program with different kinds of User input

• Pushing code to GitHub.

• Creating this specification document highlighting application capabilities, appearance, and user interactions.

Core concepts used in project

Variables, data types, operators, type casting, control statements, class, objects, access specifiers, and core keywords like final, this, and static
